# **Axiomatic Semantics**

Renato Neves

## **Semantics for Every Season**

Operational semantics

Denotational semantics

Axiomatic semantics

How a program operates

What a program is

Which logical properties it satisfies

Renato Neves 2 / 20

### **Table of Contents**

Motivation

Key Points

Motivation 3 / 20

## A Brief Warm-up

Solve the following exercises via your favorite semantics

- Calculate the output of x := 1; x := 2
- Show that the following program outputs a state with  $x \ge 2$

if 
$$x = 1$$
 then  $x := 2$  else  $x := 3$ 

Show that the following program is the factorial function

$$\textbf{while} \; x > 0 \; \{ \texttt{y} := \texttt{x} \times \texttt{y} \; ; \, \texttt{x} := \texttt{x} - 1 \}$$

Motivation 4 / 20

## A Brief Warm-up

Solve the following exercises via your favorite semantics

- Calculate the output of x := 1; x := 2
- Show that the following program outputs a state with  $x \ge 2$

if 
$$x = 1$$
 then  $x := 2$  else  $x := 3$ 

Show that the following program is the factorial function

while 
$$x > 0 \{ y := x \times y ; x := x - 1 \}$$

#### Hard?

Renato Neves Motivation 4 / 20

# The Right Tools

```
Two last exercises were about post-conditions ... not exactly about determining output ... nor about program equivalence
```

Renato Neves Motivation 5 / 20

# The Right Tools

```
Two last exercises were about post-conditions . . .
not exactly about determining output ...
nor about program equivalence
```

Do we have the right semantics for solving them?

Motivation 5 / 20

### **Table of Contents**

Motivation

**Key Points** 

Weakest Precondition Semantics

Hoare Calculus

# **Key Points**

Focussed on output properties and less on outputs themselves

Centred around a logic (for reasoning about these properties)

Semantic rules are thus more logic oriented

Renato Neves Key Points 7 / 20

# **Key Points**

Focussed on output properties and less on outputs themselves

Centred around a logic (for reasoning about these properties)

Semantic rules are thus more logic oriented

Good for program correctness (recall 'algorithms and complexity')

**Key Points** 7 / 20

# **Hoare Triples**

Axiomatic semantics essentially about (dis)proving

$$\{\Phi\} p \{\Psi\}$$

"If  $\Phi$  holds at the input then  $\Psi$  holds at the output"

### **Examples**

- $\{tt\} p \{x \ge 2\}$
- $\{x = n \land y = 1\} p \{y = n!\}$

Renato Neves **Key Points** 8 / 20

Can we state mathematically what a Hoare triple really means?

**Key Points** 9 / 20

Can we state mathematically what a Hoare triple really means?

Question rooted on what a program means (recall our lectures)

... and of course on the choice of a logic for properties

Renato Neves Key Points 9 / 20

Can we state mathematically what a Hoare triple really means?

Question rooted on what a program means (recall our lectures)

... and of course on the choice of a logic for properties

Right choice often not obvious ...

Renato Neves Key Points 9 / 20

### The Choice

Often varies depending on the problem at hand

... but typically the case that  $\Phi$  corresponds to a subset

$$[\![\Phi]\!]\subseteq \mathrm{State}_{\bot}$$

('the elements of  $State_{\perp}$  at which  $\Phi$  holds')

**Key Points** 10 / 20

### The Choice

Often varies depending on the problem at hand

 $\dots$  but typically the case that  $\Phi$  corresponds to a subset

$$\llbracket \Phi \rrbracket \subseteq \operatorname{State}_{\bot}$$

('the elements of  $State_{\perp}$  at which  $\Phi$  holds')

Scientists typically fix on the well-established first-order-logic

... which however brings its own set of problems

Renato Neves Key Points 10 / 20

$$\{\Phi\}\,\mathrm{p}\,\{\Psi\}\qquad \mathsf{means}\qquad \Big(\,x\in[\![\Phi]\!]\Longrightarrow[\![\mathrm{p}]\!](x)\in[\![\Psi]\!]\,\Big)$$

**Key Points** 11 / 20

$$\{\Phi\} p \{\Psi\}$$
 means  $\left(x \in \llbracket \Phi \rrbracket \Longrightarrow \llbracket p \rrbracket(x) \in \llbracket \Psi \rrbracket \right)$ 

Remarkably note the following equivalence

$$\Big(\,x\in\llbracket\Phi\rrbracket\Longrightarrow\llbracket\mathtt{p}\rrbracket(x)\in\llbracket\Psi\rrbracket\,\Big)\quad\text{ iff }\quad\llbracket\Phi\rrbracket\subseteq\llbracket\mathtt{p}\rrbracket^{-1}(\llbracket\psi\rrbracket)$$

It is at the root of a rich theory of

'backward transformations' known as predicate transformers

**Key Points** 11 / 20

### Liberals vs. Conservatives

In the sequel we will consider only liberal conditions

... i.e. every predicate  $\Phi$  will have  $\bot \in \llbracket \Phi \rrbracket$ 

Entails that we are working only with partial correctness

... i.e. no predicate enforces termination

Renato Neves Key Points 12 / 20

## Argue informally whether the triples below hold

- {tt} while tt skip {ff}
- $\{tt\}$  if b then x := 2 else  $x := 3 \{x > 2\}$
- $\{x = a \land v = b\}\ x := y : y := x \{x = b \land y = a\}$
- $\{x = a \land y = b\}\ x := aux; x := y; y := aux \{x = b \land y = a\}$
- $\{x = n \land v = 1\}$  fact  $\{v = n!\}$

Key Points 13 / 20

### **Table of Contents**

Motivation

**Key Points** 

Weakest Precondition Semantics

Hoare Calculus

### What and Why

Focus is on deriving the  $\underline{\text{weakest}}$  condition  $\Phi$  such that

$$\left\{\Phi\right\}p\left\{\Psi\right\} \qquad \Big(\text{ iff } \llbracket\Phi\rrbracket\subseteq\llbracket p\rrbracket^{-1}(\llbracket\Psi\rrbracket)\,\Big)$$

## What and Why

Focus is on deriving the  $\underline{\text{weakest}}$  condition  $\Phi$  such that

$$\left\{\Phi\right\}p\left\{\Psi\right\} \qquad \Big(\text{ iff } \llbracket\Phi\rrbracket\subseteq\llbracket p\rrbracket^{-1}(\llbracket\Psi\rrbracket) \;\Big)$$

 $\Phi$  'weaker' (i.e. less restrictive) than  $\Phi'$  means  $[\![\Phi]\!] \supseteq [\![\Phi']\!]$ 

## What and Why

Focus is on deriving the  $\underline{\text{weakest}}$  condition  $\Phi$  such that

$$\left\{\Phi\right\}p\left\{\Psi\right\} \qquad \Big(\text{ iff } \llbracket\Phi\rrbracket\subseteq\llbracket p\rrbracket^{-1}(\llbracket\Psi\rrbracket) \,\Big)$$

 $\Phi$  'weaker' (i.e. less restrictive) than  $\Phi'$  means  $[\![\Phi]\!] \supseteq [\![\Phi']\!]$ 

To <u>understand</u> a program amounts to knowing the weakest precondition that ensures a given postcondition

### The Semantics

$$\begin{split} \operatorname{wp} \big( \mathtt{x} := \mathtt{e}, \Phi \big) &= \Phi[\mathtt{e}/\mathtt{x}] \\ & \operatorname{wp} \big( \mathtt{p} \, ; \, \mathtt{q}, \Phi \big) = \operatorname{wp} \big( \mathtt{q}, \operatorname{wp} \big( \mathtt{p}, \Phi \big) \big) \\ & \operatorname{wp} \big( \mathtt{if} \, \mathtt{b} \, \mathtt{then} \, \mathtt{p} \, \mathtt{else} \, \mathtt{q}, \Phi \big) = \mathtt{b} \wedge \operatorname{wp} \big( \mathtt{p}, \Phi \big) \, \vee \, \neg \mathtt{b} \wedge \operatorname{wp} \big( \mathtt{q}, \Phi \big) \\ & \operatorname{wp} \big( \mathtt{while} \, \mathtt{b} \, \mathtt{do} \, \{ \, \mathtt{p} \, \}, \Phi \big) = \, \dots \end{split}$$

#### **Exercises**

## Calculate the weakest preconditions w.r.t. the following pairs

- $(x := y, x \ge 1)$
- (if b then x := 2 else x := 3,  $x \ge 2$ )
- $(x := y; y := x, x = b \land y = a)$
- $(x := aux; x := y; y := aux, x = b \land y = a)$

#### The Semantics

$$\begin{split} \operatorname{wp} \big( \mathtt{x} := \mathtt{e}, \Phi \big) &= \Phi[\mathtt{e}/\mathtt{x}] \\ \operatorname{wp} \big( \mathtt{p} \, ; \, \mathtt{q}, \Phi \big) &= \operatorname{wp} \big( \mathtt{q}, \operatorname{wp} \big( \mathtt{p}, \Phi \big) \big) \\ \\ \operatorname{wp} \big( \mathtt{if} \, \mathtt{b} \, \mathtt{then} \, \mathtt{p} \, \mathtt{else} \, \mathtt{q}, \Phi \big) &= \mathtt{b} \wedge \operatorname{wp} \big( \mathtt{p}, \Phi \big) \, \vee \, \neg \mathtt{b} \wedge \operatorname{wp} \big( \mathtt{q}, \Phi \big) \\ \\ \operatorname{wp} \big( \mathtt{while} \, \mathtt{b} \, \mathtt{do} \, \{ \, \mathtt{p} \, \}, \Phi \big) &= \bigwedge_{n \in \mathbb{N}} \Psi_n \end{split}$$

### The Semantics

$$\begin{split} \operatorname{wp} \left( \mathtt{x} := \mathtt{e}, \Phi \right) &= \Phi[\mathtt{e}/\mathtt{x}] \\ \operatorname{wp} \left( \mathtt{p} \, ; \, \mathtt{q}, \Phi \right) &= \operatorname{wp} \left( \mathtt{q}, \operatorname{wp} \left( \mathtt{p}, \Phi \right) \right) \\ \operatorname{wp} \left( \mathtt{if} \, \mathtt{b} \, \mathtt{then} \, \mathtt{p} \, \mathtt{else} \, \mathtt{q}, \Phi \right) &= \mathtt{b} \wedge \operatorname{wp} \left( \mathtt{p}, \Phi \right) \, \vee \, \neg \mathtt{b} \wedge \operatorname{wp} \left( \mathtt{q}, \Phi \right) \\ \operatorname{wp} \left( \mathtt{while} \, \mathtt{b} \, \mathtt{do} \, \left\{ \, \mathtt{p} \, \right\}, \Phi \right) &= \bigwedge_{n \in \mathbb{N}} \Psi_n \\ \\ \Psi_0 &= \mathtt{tt} \\ \Psi_{n+1} &= \neg \mathtt{b} \wedge \Phi \, \vee \, \mathtt{b} \wedge \operatorname{wp} \left( \mathtt{p}, \Psi_n \right) \end{split}$$

## **Unfolding While-loops**

$$\begin{split} & \operatorname{wp} \left( \text{while b do } \left\{ \right. p \right. \right), \Phi \right) \\ & = \Psi_0 \\ & \wedge \neg b \wedge \Phi \ \lor \ b \wedge \operatorname{wp} \left( p, \Psi_0 \right) \quad \text{(terminates with } \Phi \text{ or iterates once and then } \underline{*} \right)^{**} \\ & \wedge \neg b \wedge \Phi \ \lor \ b \wedge \operatorname{wp} \left( p, \Psi_1 \right) \quad \text{(terminates with } \Phi \text{ or iterates once and then } \underline{*} \right) \\ & \wedge \dots \end{split}$$

## **Unfolding While-loops**

$$\begin{split} &\operatorname{wp}\left(\text{while b do } \left\{ \right. p \left. \right\}, \Phi \right) \\ &= \Psi_0 & \left( \operatorname{trivial} \right)^* \\ &\wedge \neg b \wedge \Phi \, \vee \, b \wedge \operatorname{wp}\left(p, \Psi_0\right) \quad (\underline{\text{terminates}} \, \text{with } \Phi \, \underline{\text{or iterates once}} \, \text{and then } \underline{\ }^* )^{**} \\ &\wedge \neg b \wedge \Phi \, \vee \, b \wedge \operatorname{wp}\left(p, \Psi_1\right) \quad (\underline{\text{terminates}} \, \text{with } \Phi \, \underline{\text{or iterates once}} \, \text{and then } \underline{\ }^{**} ) \\ &\wedge \dots \end{split}$$

Infinitary formula tracks when the loop terminates

 $\dots$  in which case it enforces  $\Phi$ 

Each conjunct  $\Psi_{n+1}$  tracks up to n iterations
